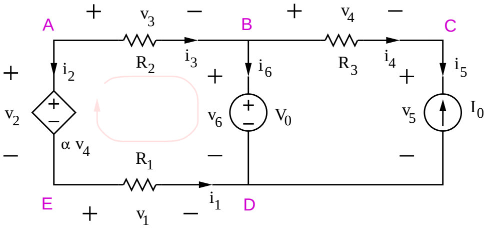
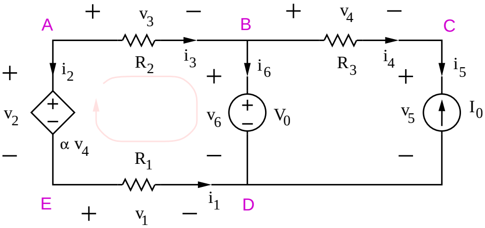
* Kirchhoff's current law (KCL):
  $\sum i_k = 0$ at each node.

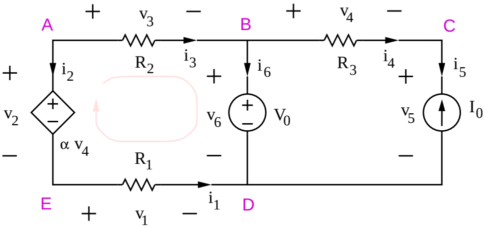


* Kirchhoff's current law (KCL):
  $\sum i_k = 0$ at each node.
  e.g., at node B, $-i_3 + i_6 + i_4 = 0$.



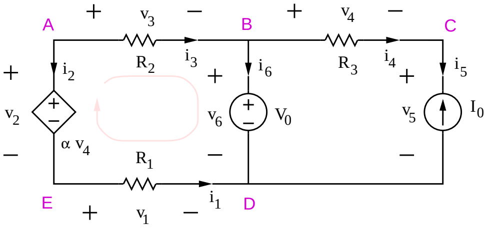
∗ Kirchhoff's current law (KCL):
$\sum i_k = 0$ at each node.
e.g., at node B, $-i_3 + i_6 + i_4 = 0$.
(We have followed the convention that current *leaving* a node is positive.)

Kirchhoff's laws

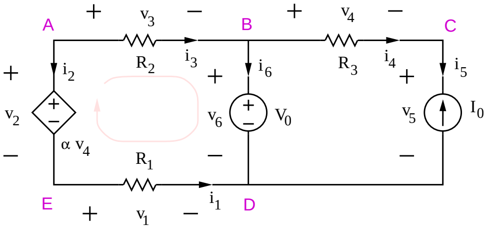


* Kirchhoff's current law (KCL):
  $\sum i_k = 0$ at each node.
  e.g., at node B, $-i_3 + i_6 + i_4 = 0$.
  (We have followed the convention that current *leaving* a node is positive.)
* Kirchhoff's voltage law (KVL):
  $\sum v_k = 0$ for each loop.

Kirchhoff's laws



* Kirchhoff's current law (KCL):
  $\sum i_k = 0$ at each node.
  e.g., at node B, $-i_3 + i_6 + i_4 = 0$.
  (We have followed the convention that current *leaving* a node is positive.)
* Kirchhoff's voltage law (KVL):
  $\sum v_k = 0$ for each loop.
  e.g., $v_3 + v_6 - v_1 - v_2 = 0$.



* Kirchhoff's current law (KCL):
  $\sum i_k = 0$ at each node.
  e.g., at node B, $-i_3 + i_6 + i_4 = 0$.
  (We have followed the convention that current *leaving* a node is positive.)
* Kirchhoff's voltage law (KVL):
  $\sum v_k = 0$ for each loop.
  e.g., $v_3 + v_6 - v_1 - v_2 = 0$.
  (We have followed the convention that voltage *drop* across a branch is positive.)

Circuit elements

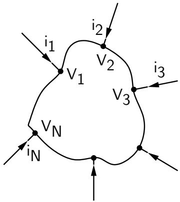
Element	Symbol	Equation
Resistor		$v = R\,i$
Inductor		$v = L\,\dfrac{di}{dt}$
Capacitor		$i = C\,\dfrac{dv}{dt}$
Diode		to be discussed
BJT		to be discussed

Sources

	Element	Symbol	Equation
Independent	Voltage source		$v(t) = v_s(t)$
	Current source		$i(t) = i_s(t)$
Dependent	VCVS		$v(t) = \alpha\, v_c(t)$
	VCCS		$i(t) = g\, v_c(t)$
	CCVS		$v(t) = r\, i_c(t)$
	CCCS		$i(t) = \beta\, i_c(t)$

* α, β: dimensionless, r: Ω, g: Ω^{-1} or ℧ ("mho")
* The subscript 'c' denotes the controlling voltage or current.

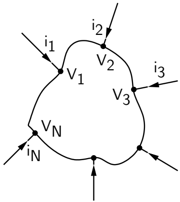
Instantaneous power absorbed by an element



$$P(t) = V_1(t)\, i_1(t) + V_2(t)\, i_2(t) + \cdots + V_N(t)\, i_N(t)\,,$$

where V_1, V_2, etc. are "node voltages" (measured with respect to a reference node).

Instantaneous power absorbed by an element



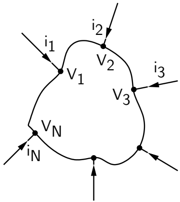
$$P(t) = V_1(t)\, i_1(t) + V_2(t)\, i_2(t) + \cdots + V_N(t)\, i_N(t)\,,$$

where V_1, V_2, etc. are "node voltages" (measured with respect to a reference node).

* two-terminal element:

$$\begin{aligned} P &= V_1\, i_1 + V_2\, i_2 \\ &= V_1\, i_1 + V_2\,(-i_1) \\ &= [V_1 - V_2]\; i_1 = v\, i_1 \end{aligned}$$

Instantaneous power absorbed by an element



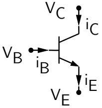
$$P(t) = V_1(t)\, i_1(t) + V_2(t)\, i_2(t) + \cdots + V_N(t)\, i_N(t)\,,$$

where V_1, V_2, etc. are "node voltages" (measured with respect to a reference node).

* two-terminal element:

$$\begin{aligned} P &= V_1\, i_1 + V_2\, i_2 \\ &= V_1\, i_1 + V_2\, (-i_1) \\ &= [V_1 - V_2]\, i_1 = v\, i_1 \end{aligned}$$

* three-terminal element:



$$\begin{aligned} P &= V_B\, i_B + V_C\, i_C + V_E\, (-i_E) \\ &= V_B\, i_B + V_C\, i_C - V_E\, (i_B + i_C) \\ &= (V_B - V_E)\, i_B + (V_C - V_E)\, i_C \\ &= V_{BE}\, i_B + V_{CE}\, i_E \end{aligned}$$

* A resistor can only *absorb* power (from the circuit) since v and i have the same sign, making $P > 0$. The energy "absorbed" by a resistor goes in heating the resistor and the rest of the world.

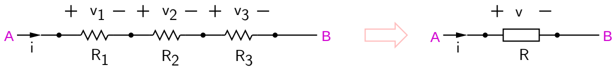
Instantaneous power

* A resistor can only *absorb* power (from the circuit) since v and i have the same sign, making $P > 0$. The energy "absorbed" by a resistor goes in heating the resistor and the rest of the world.
* Often, a "heat sink" is provided to dissipate the thermal energy effectively so that the device temperature does not become too high.

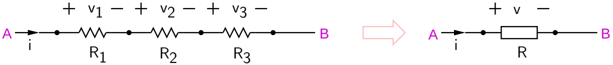
* A resistor can only *absorb* power (from the circuit) since v and i have the same sign, making $P > 0$. The energy "absorbed" by a resistor goes in heating the resistor and the rest of the world.
* Often, a "heat sink" is provided to dissipate the thermal energy effectively so that the device temperature does not become too high.
* A source (e.g., a DC voltage source) can absorb *or* deliver power since the signs of v and i are independent. For example, when a battery is charged, it absorbs energy which gets stored within.

* A resistor can only *absorb* power (from the circuit) since v and i have the same sign, making $P > 0$. The energy "absorbed" by a resistor goes in heating the resistor and the rest of the world.
* Often, a "heat sink" is provided to dissipate the thermal energy effectively so that the device temperature does not become too high.
* A source (e.g., a DC voltage source) can absorb *or* deliver power since the signs of v and i are independent. For example, when a battery is charged, it absorbs energy which gets stored within.
* A capacitor can absorb or deliver power. When it is absorbing power, its charge builds up. Similarly, an inductor can store energy (in the form of magnetic flux).

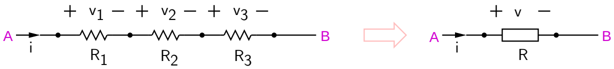
Resistors in series



Resistors in series

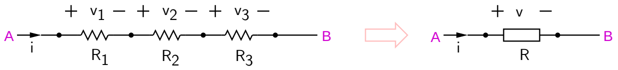


$$v_1 = i\,R_1,\ v_2 = i\,R_2,\ v_3 = i\,R_3,\ \Rightarrow\ v = v_1 + v_2 + v_3 = i\,(R_1 + R_2 + R_3)$$



$v_1 = i\,R_1,\ v_2 = i\,R_2,\ v_3 = i\,R_3,\ \Rightarrow\ v = v_1 + v_2 + v_3 = i\,(R_1 + R_2 + R_3)$

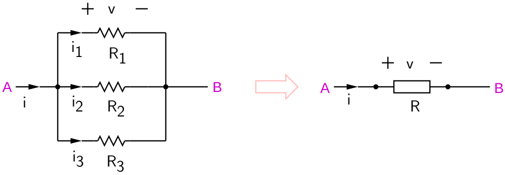
* The equivalent resistance is $R_{eq} = R_1 + R_2 + R_3$.

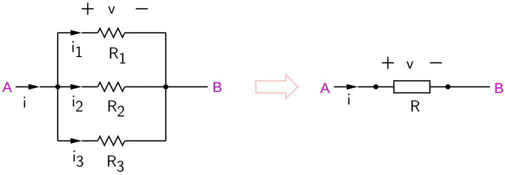


$$v_1 = i\,R_1,\; v_2 = i\,R_2,\; v_3 = i\,R_3,\; \Rightarrow\; v = v_1 + v_2 + v_3 = i\,(R_1 + R_2 + R_3)$$

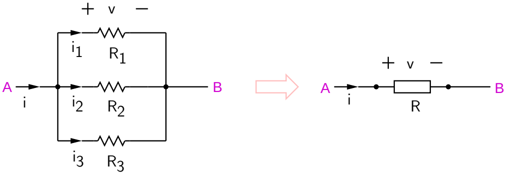
* The equivalent resistance is $R_{eq} = R_1 + R_2 + R_3$.
* The voltage drop across R_k is $v \times \dfrac{R_k}{R_{eq}}$.

Resistors in parallel



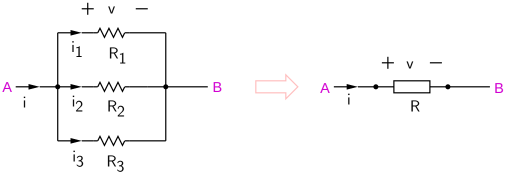


$i_1 = G_1\, v,\ i_2 = G_2\, v,\ i_3 = G_3\, v$, where $G_1 = 1/R_1$, etc.
$\Rightarrow\ i = i_1 + i_2 + i_3 = (G_1 + G_2 + G_3)\, v\,.$



$i_1 = G_1\, v,\ i_2 = G_2\, v,\ i_3 = G_3\, v$, where $G_1 = 1/R_1$, etc.
$\Rightarrow i = i_1 + i_2 + i_3 = (G_1 + G_2 + G_3)\, v$.

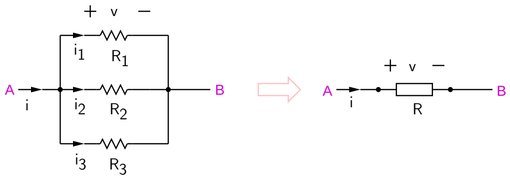
* The equivalent conductance is $G_{eq} = G_1 + G_2 + G_3$, and the equivalent resistance is $R_{eq} = 1/G_{eq}$.



$i_1 = G_1\,v$, $i_2 = G_2\,v$, $i_3 = G_3\,v$, where $G_1 = 1/R_1$, etc.
$\Rightarrow\ i = i_1 + i_2 + i_3 = (G_1 + G_2 + G_3)\,v$.

* The equivalent conductance is $G_{eq} = G_1 + G_2 + G_3$, and the equivalent resistance is $R_{eq} = 1/G_{eq}$.
* The current through R_k is $i \times \dfrac{G_k}{G_{eq}}$.

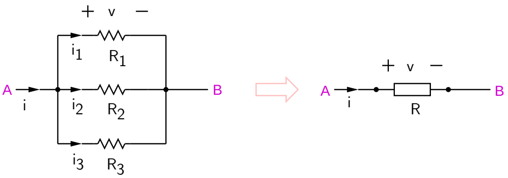
Resistors in parallel



$i_1 = G_1\,v,\ i_2 = G_2\,v,\ i_3 = G_3\,v$, where $G_1 = 1/R_1$, etc.
$\Rightarrow i = i_1 + i_2 + i_3 = (G_1 + G_2 + G_3)\,v$.

* The equivalent conductance is $G_{eq} = G_1 + G_2 + G_3$, and the equivalent resistance is $R_{eq} = 1/G_{eq}$.
* The current through R_k is $i \times \dfrac{G_k}{G_{eq}}$.
* If $N = 2$, we have

  $$R_{eq} = \frac{R_1\,R_2}{R_1 + R_2},\ i_1 = i \times \frac{R_2}{R_1 + R_2},\ i_2 = i \times \frac{R_1}{R_1 + R_2}.$$



$i_1 = G_1\,v,\ i_2 = G_2\,v,\ i_3 = G_3\,v$, where $G_1 = 1/R_1$, etc.
$\Rightarrow\ i = i_1 + i_2 + i_3 = (G_1 + G_2 + G_3)\,v$.

* The equivalent conductance is $G_{eq} = G_1 + G_2 + G_3$, and the equivalent resistance is $R_{eq} = 1/G_{eq}$.
* The current through R_k is $i \times \dfrac{G_k}{G_{eq}}$.
* If $N = 2$, we have

  $$R_{eq} = \frac{R_1\,R_2}{R_1 + R_2},\ i_1 = i \times \frac{R_2}{R_1 + R_2},\ i_2 = i \times \frac{R_1}{R_1 + R_2}.$$
* If $R_k = 0$, all of the current will go through R_k.

Example

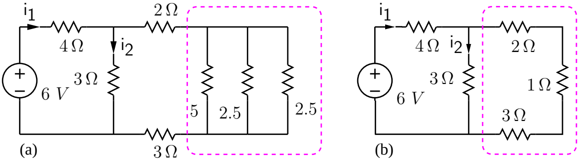
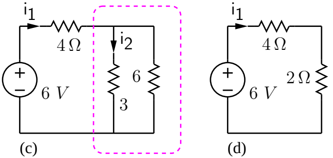
$$i_1 = \frac{6\,\mathrm{V}}{4\,\Omega + 2\,\Omega} = 1\,\mathrm{A}\,.$$

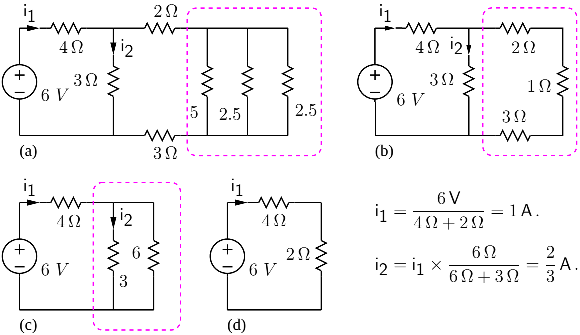
Example





$$\mathrm{i}_1 = \frac{6\,\mathrm{V}}{4\,\Omega + 2\,\Omega} = 1\,\mathrm{A}\,.$$

$$\mathrm{i}_2 = \mathrm{i}_1 \times \frac{6\,\Omega}{6\,\Omega + 3\,\Omega} = \frac{2}{3}\,\mathrm{A}\,.$$

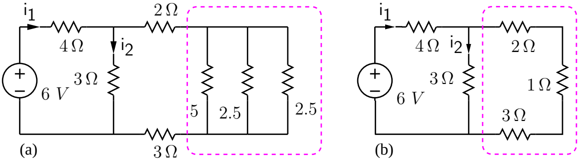


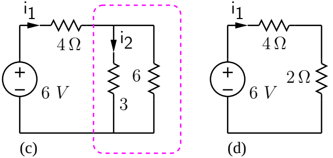
$$i_1 = \frac{6\,\text{V}}{4\,\Omega + 2\,\Omega} = 1\,\text{A}\,.$$

$$i_2 = i_1 \times \frac{6\,\Omega}{6\,\Omega + 3\,\Omega} = \frac{2}{3}\,\text{A}\,.$$

Home work:

* Verify that KCL and KVL are satisfied for each node/loop.





$$i_1 = \frac{6\,\mathrm{V}}{4\,\Omega + 2\,\Omega} = 1\,\mathrm{A}\,.$$

$$i_2 = i_1 \times \frac{6\,\Omega}{6\,\Omega + 3\,\Omega} = \frac{2}{3}\,\mathrm{A}\,.$$

Home work:

- ∗ Verify that KCL and KVL are satisfied for each node/loop.
- ∗ Verify that the total power absorbed by the resistors is equal to the power supplied by the source.

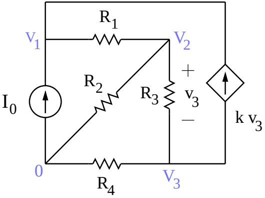
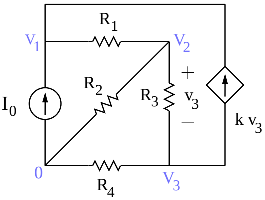
* Take some node as the "reference node" and denote the node voltages of the remaining nodes by V_1, V_2, etc.



* Take some node as the "reference node" and denote the node voltages of the remaining nodes by V_1, V_2, etc.
* Write KCL at each node in terms of the node voltages. Follow a fixed convention, e.g., current *leaving* a node is *positive*.

Nodal analysis

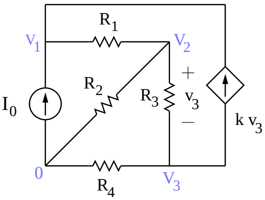


* Take some node as the "reference node" and denote the node voltages of the remaining nodes by V_1, V_2, etc.
* Write KCL at each node in terms of the node voltages. Follow a fixed convention, e.g., current *leaving* a node is *positive*.

$$\frac{1}{R_1}(V_1 - V_2) - I_0 - k\,(V_2 - V_3) = 0\,,$$

$$\frac{1}{R_1}(V_2 - V_1) + \frac{1}{R_3}(V_2 - V_3) + \frac{1}{R_2}(V_2) = 0\,,$$

$$k\,(V_2 - V_3) + \frac{1}{R_3}(V_3 - V_2) + \frac{1}{R_4}(V_3) = 0\,.$$



* Take some node as the "reference node" and denote the node voltages of the remaining nodes by V_1, V_2, etc.

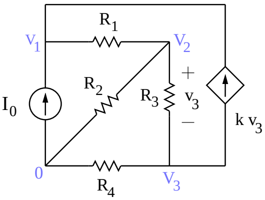
* Write KCL at each node in terms of the node voltages. Follow a fixed convention, e.g., current *leaving* a node is *positive*.

$$\frac{1}{R_1}(V_1 - V_2) - I_0 - k\,(V_2 - V_3) = 0\,,$$

$$\frac{1}{R_1}(V_2 - V_1) + \frac{1}{R_3}(V_2 - V_3) + \frac{1}{R_2}(V_2) = 0\,,$$

$$k\,(V_2 - V_3) + \frac{1}{R_3}(V_3 - V_2) + \frac{1}{R_4}(V_3) = 0\,.$$

* Solve for the node voltages → branch voltages and currents.



* Take some node as the "reference node" and denote the node voltages of the remaining nodes by V_1, V_2, etc.

* Write KCL at each node in terms of the node voltages. Follow a fixed convention, e.g., current *leaving* a node is *positive*.

$$\frac{1}{R_1}(V_1 - V_2) - I_0 - k\,(V_2 - V_3) = 0\,,$$

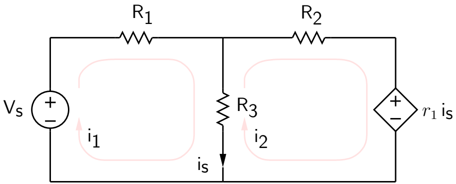
$$\frac{1}{R_1}(V_2 - V_1) + \frac{1}{R_3}(V_2 - V_3) + \frac{1}{R_2}(V_2) = 0\,,$$

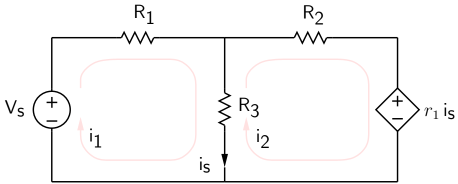
$$k\,(V_2 - V_3) + \frac{1}{R_3}(V_3 - V_2) + \frac{1}{R_4}(V_3) = 0\,.$$

* Solve for the node voltages → branch voltages and currents.

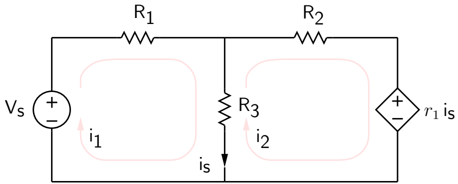
* Remark: Nodal analysis needs to be modified if there are voltage sources.

Mesh analysis



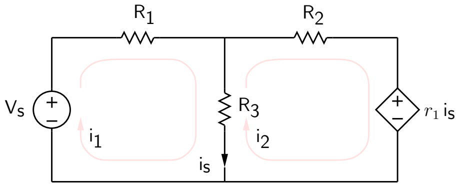


* Write KVL for each loop in terms of the "mesh currents" i_1 and i_2. Use a fixed convention, e.g., voltage drop is positive. (Note that $i_s = i_1 - i_2$.)



∗ Write KVL for each loop in terms of the "mesh currents" i_1 and i_2. Use a fixed convention, e.g., voltage drop is positive. (Note that $i_s = i_1 - i_2$.)

$$-V_s + i_1\,R_1 + (i_1 - i_2)\,R_3 = 0\,,$$
$$R_2\,i_2 + r_1\,(i_1 - i_2) + (i_2 - i_1)\,R_3 = 0\,.$$



* Write KVL for each loop in terms of the "mesh currents" i_1 and i_2. Use a fixed convention, e.g., voltage drop is positive. (Note that $i_s = i_1 - i_2$.)

$$-V_s + i_1\,R_1 + (i_1 - i_2)\,R_3 = 0\,,$$

$$R_2\,i_2 + r_1\,(i_1 - i_2) + (i_2 - i_1)\,R_3 = 0\,.$$

* Solve for i_1 and i_2 $\rightarrow$ compute other quantities of interest (branch currents and branch voltages).

* A circuit containing independent sources, dependent sources, and resistors is *linear*, i.e., the system of equations describing the circuit is linear.

* A circuit containing independent sources, dependent sources, and resistors is *linear*, i.e., the system of equations describing the circuit is linear.
* The dependent sources are assumed to be linear, e.g., if we have a CCVS with $v = a\, i_c^2 + b$, the resulting system will be no longer linear.

* A circuit containing independent sources, dependent sources, and resistors is *linear*, i.e., the system of equations describing the circuit is linear.
* The dependent sources are assumed to be linear, e.g., if we have a CCVS with $v = a\, i_c^2 + b$, the resulting system will be no longer linear.
* For a linear system, we can apply the principle of superposition.

* A circuit containing independent sources, dependent sources, and resistors is *linear*, i.e., the system of equations describing the circuit is linear.
* The dependent sources are assumed to be linear, e.g., if we have a CCVS with $v = a\, i_c^2 + b$, the resulting system will be no longer linear.
* For a linear system, we can apply the principle of superposition.
* In the context of circuits, superposition enables us to consider the *independent* sources one at a time, compute the desired quantity of interest in each case, and get the net result by adding the individual contributions.

Linearity and superposition

* A circuit containing independent sources, dependent sources, and resistors is *linear*, i.e., the system of equations describing the circuit is linear.
* The dependent sources are assumed to be linear, e.g., if we have a CCVS with $v = a\, i_c^2 + b$, the resulting system will be no longer linear.
* For a linear system, we can apply the principle of superposition.
* In the context of circuits, superposition enables us to consider the *independent* sources one at a time, compute the desired quantity of interest in each case, and get the net result by adding the individual contributions.
* Caution: Superposition cannot be applied to *dependent* sources.

Superposition

* Superposition refers to superposition of response due to *independent* sources.

Superposition

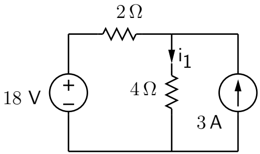
* Superposition refers to superposition of response due to *independent* sources.
* We can consider one independent source at a time, deactivate all other independent sources.

Superposition

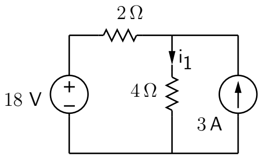
* Superposition refers to superposition of response due to *independent* sources.
* We can consider one independent source at a time, deactivate all other independent sources.
* Deactivating a current source $\Rightarrow i_s = 0$, i.e., replace the current source with an open circuit.

* Superposition refers to superposition of response due to *independent* sources.
* We can consider one independent source at a time, deactivate all other independent sources.
* Deactivating a current source $\Rightarrow i_s = 0$, i.e., replace the current source with an open circuit.
* Deactivating a voltage source $\Rightarrow v_s = 0$, i.e., replace the voltage source with a short circuit.

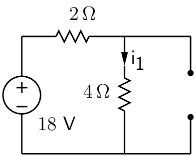
Example



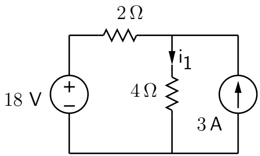
Example



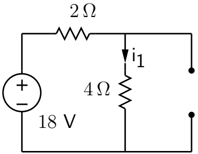
Case 1: Keep V_S, deactivate I_S.



Example

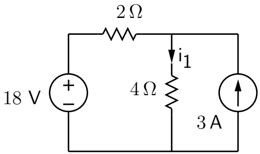


Case 1: Keep V_S, deactivate I_S.

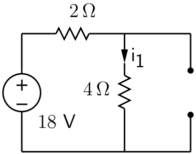


$i_1^{(1)} = 3\,\text{A}$

Example

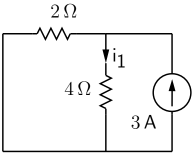


Case 1: Keep V_S, deactivate I_S.

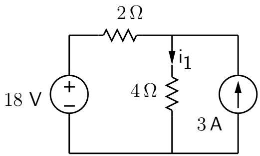


$i_1^{(1)} = 3\,\text{A}$

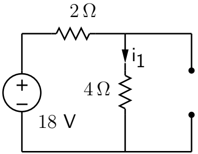
Case 2: Keep I_S, deactivate V_S.



Example

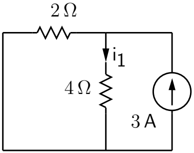


Case 1: Keep V_S, deactivate I_S.



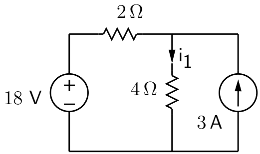
$$i_1^{(1)} = 3\,\text{A}$$

Case 2: Keep I_S, deactivate V_S.



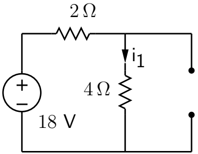
$$i_1^{(2)} = 3\,\text{A} \times \frac{2\,\Omega}{2\,\Omega + 4\,\Omega} = 1\,\text{A}$$

Example



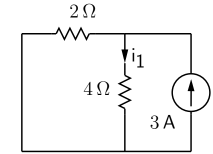
$$i_1^{\text{net}} = i_1^{(1)} + i_1^{(2)} = 3 + 1 = 4\,\text{A}$$

Case 1: Keep V_S, deactivate I_S.



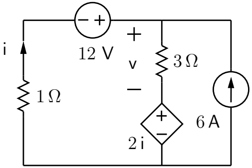
$$i_1^{(1)} = 3\,\text{A}$$

Case 2: Keep I_S, deactivate V_S.

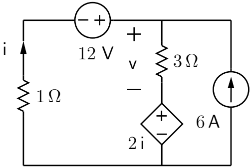


$$i_1^{(2)} = 3\,\text{A} \times \frac{2\,\Omega}{2\,\Omega + 4\,\Omega} = 1\,\text{A}$$

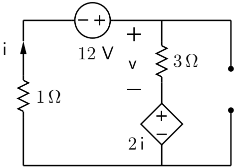
Example



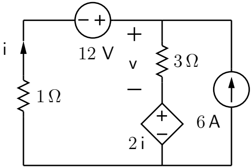
Example



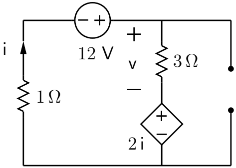
Case 1: Keep V_S, deactivate I_S.



Example



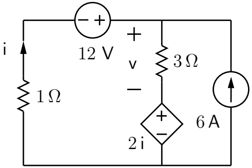
Case 1: Keep V_S, deactivate I_S.



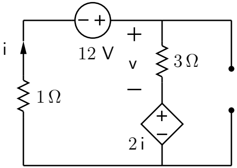
KVL: $-12 + 3\,i + 2\,i + i = 0$

$\Rightarrow i = 2\,A\,,\, v^{(1)} = 6\,V\,.$

Example



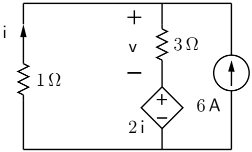
Case 1: Keep V_S, deactivate I_S.



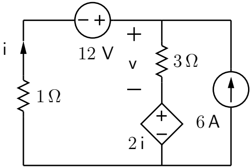
KVL: $-12 + 3\,i + 2\,i + i = 0$

$\Rightarrow i = 2\,A\,, v^{(1)} = 6\,V\,.$

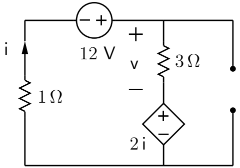
Case 2: Keep I_S, deactivate V_S.



Example



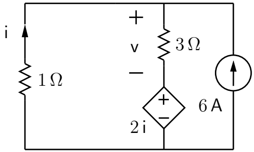
Case 1: Keep V_S, deactivate I_S.



KVL: $-12 + 3\,i + 2\,i + i = 0$

$\Rightarrow i = 2\,A\,, v^{(1)} = 6\,V\,.$

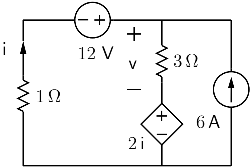
Case 2: Keep I_S, deactivate V_S.



KVL: $i + (6 + i)\,3 + 2\,i = 0$

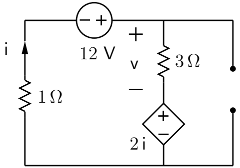
$\Rightarrow i = -3\,A\,, v^{(2)} = (-3 + 6) \times 3 = 9\,V\,.$

Example



$v^{net} = v^{(1)} + v^{(2)} = 6 + 9 = 15\,\text{V}$

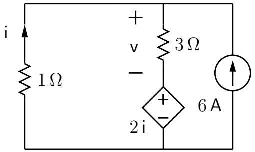
Case 1: Keep V_S, deactivate I_S.



KVL: $-12 + 3\,i + 2\,i + i = 0$

$\Rightarrow i = 2\,\text{A}\,,\, v^{(1)} = 6\,\text{V}\,.$

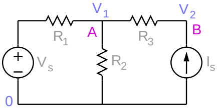
Case 2: Keep I_S, deactivate V_S.



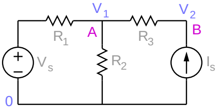
KVL: $i + (6 + i)\,3 + 2\,i = 0$

$\Rightarrow i = -3\,\text{A}\,,\, v^{(2)} = (-3 + 6) \times 3 = 9\,\text{V}\,.$

Superposition: Why does it work?



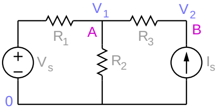
Superposition: Why does it work?



KCL at nodes A and B:

$$\frac{1}{R_1}(V_1 - V_s) + \frac{1}{R_2}V_1 + \frac{1}{R_3}(V_1 - V_2) = 0\,,$$

$$-I_s + \frac{1}{R_3}(V_2 - V_1) = 0\,.$$



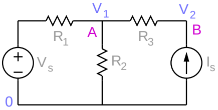
KCL at nodes A and B:

$$\frac{1}{R_1}(V_1 - V_s) + \frac{1}{R_2}V_1 + \frac{1}{R_3}(V_1 - V_2) = 0\,,$$

$$-I_s + \frac{1}{R_3}(V_2 - V_1) = 0\,.$$

Writing in a matrix form, we get (using $G_1 = 1/R_1$, etc.),

$$\begin{bmatrix} G_1 + G_2 + G_3 & -G_3 \\ -G_3 & G_3 \end{bmatrix} \begin{bmatrix} V_1 \\ V_2 \end{bmatrix} = \begin{bmatrix} G_1 V_s \\ I_s \end{bmatrix}$$



KCL at nodes A and B:

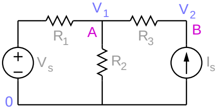
$$\frac{1}{R_1}(V_1 - V_s) + \frac{1}{R_2}V_1 + \frac{1}{R_3}(V_1 - V_2) = 0\,,$$
$$-I_s + \frac{1}{R_3}(V_2 - V_1) = 0\,.$$

Writing in a matrix form, we get (using $G_1 = 1/R_1$, etc.),

$$\begin{bmatrix} G_1 + G_2 + G_3 & -G_3 \\ -G_3 & G_3 \end{bmatrix} \begin{bmatrix} V_1 \\ V_2 \end{bmatrix} = \begin{bmatrix} G_1 V_s \\ I_s \end{bmatrix}$$

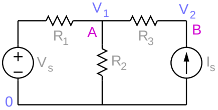
$$\text{i.e.,} \quad \mathbf{A} \begin{bmatrix} V_1 \\ V_2 \end{bmatrix} = \begin{bmatrix} G_1 V_s \\ I_s \end{bmatrix} \rightarrow \begin{bmatrix} V_1 \\ V_2 \end{bmatrix} = \mathbf{A}^{-1} \begin{bmatrix} G_1 V_s \\ I_s \end{bmatrix}.$$

Superposition: Why does it work?



$$\begin{bmatrix} V_1 \\ V_2 \end{bmatrix} = \mathbf{A}^{-1} \begin{bmatrix} G_1 V_s \\ I_s \end{bmatrix} \equiv \begin{bmatrix} m_{11} & m_{12} \\ m_{21} & m_{22} \end{bmatrix} \begin{bmatrix} G_1 V_s \\ I_s \end{bmatrix}.$$

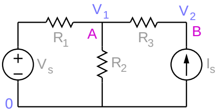
Superposition: Why does it work?



$$\begin{bmatrix} V_1 \\ V_2 \end{bmatrix} = \mathbf{A}^{-1} \begin{bmatrix} G_1 V_s \\ I_s \end{bmatrix} \equiv \begin{bmatrix} m_{11} & m_{12} \\ m_{21} & m_{22} \end{bmatrix} \begin{bmatrix} G_1 V_s \\ I_s \end{bmatrix} .$$

We are now in a position to see why superposition works.

$$\begin{bmatrix} V_1 \\ V_2 \end{bmatrix} = \begin{bmatrix} m_{11} G_1 & m_{12} \\ m_{21} G_1 & m_{22} \end{bmatrix} \begin{bmatrix} V_s \\ 0 \end{bmatrix} + \begin{bmatrix} m_{11} G_1 & m_{12} \\ m_{21} G_1 & m_{22} \end{bmatrix} \begin{bmatrix} 0 \\ I_s \end{bmatrix} \equiv \begin{bmatrix} V_1^{(1)} \\ V_2^{(1)} \end{bmatrix} + \begin{bmatrix} V_1^{(2)} \\ V_2^{(2)} \end{bmatrix} .$$



$$\begin{bmatrix} V_1 \\ V_2 \end{bmatrix} = \mathbf{A}^{-1} \begin{bmatrix} G_1 V_s \\ I_s \end{bmatrix} \equiv \begin{bmatrix} m_{11} & m_{12} \\ m_{21} & m_{22} \end{bmatrix} \begin{bmatrix} G_1 V_s \\ I_s \end{bmatrix} .$$

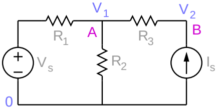
We are now in a position to see why superposition works.

$$\begin{bmatrix} V_1 \\ V_2 \end{bmatrix} = \begin{bmatrix} m_{11} G_1 & m_{12} \\ m_{21} G_1 & m_{22} \end{bmatrix} \begin{bmatrix} V_s \\ 0 \end{bmatrix} + \begin{bmatrix} m_{11} G_1 & m_{12} \\ m_{21} G_1 & m_{22} \end{bmatrix} \begin{bmatrix} 0 \\ I_s \end{bmatrix} \equiv \begin{bmatrix} V_1^{(1)} \\ V_2^{(1)} \end{bmatrix} + \begin{bmatrix} V_1^{(2)} \\ V_2^{(2)} \end{bmatrix} .$$

The first vector is the response due to V_s alone (and I_s deactivated).

The second vector is the response due to I_s alone (and V_s deactivated).

Superposition: Why does it work?



$$\begin{bmatrix} V_1 \\ V_2 \end{bmatrix} = \mathbf{A}^{-1} \begin{bmatrix} G_1 V_s \\ I_s \end{bmatrix} \equiv \begin{bmatrix} m_{11} & m_{12} \\ m_{21} & m_{22} \end{bmatrix} \begin{bmatrix} G_1 V_s \\ I_s \end{bmatrix} .$$

We are now in a position to see why superposition works.

$$\begin{bmatrix} V_1 \\ V_2 \end{bmatrix} = \begin{bmatrix} m_{11} G_1 & m_{12} \\ m_{21} G_1 & m_{22} \end{bmatrix} \begin{bmatrix} V_s \\ 0 \end{bmatrix} + \begin{bmatrix} m_{11} G_1 & m_{12} \\ m_{21} G_1 & m_{22} \end{bmatrix} \begin{bmatrix} 0 \\ I_s \end{bmatrix} \equiv \begin{bmatrix} V_1^{(1)} \\ V_2^{(1)} \end{bmatrix} + \begin{bmatrix} V_1^{(2)} \\ V_2^{(2)} \end{bmatrix} .$$

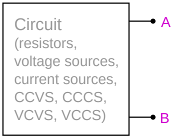
The first vector is the response due to V_s alone (and I_s deactivated).

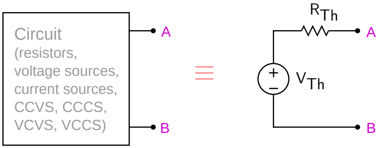
The second vector is the response due to I_s alone (and V_s deactivated).

All other currents and voltages are linearly related to V_1 and V_2

$\Rightarrow$ Any voltage (node voltage or branch voltage) or current can also be computed using superposition.

Thevenin's theorem





Circuit

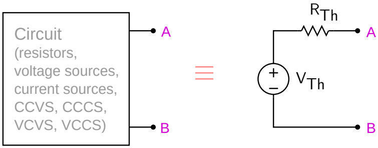
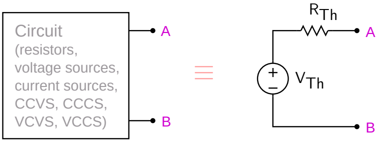
* V_{Th} is simply V_{AB} when nothing is connected on the other side, i.e., $V_{Th} = V_{oc}$.



* V_{Th} is simply V_{AB} when nothing is connected on the other side, i.e., $V_{Th} = V_{oc}$.
* R_{Th} can be found by different methods.

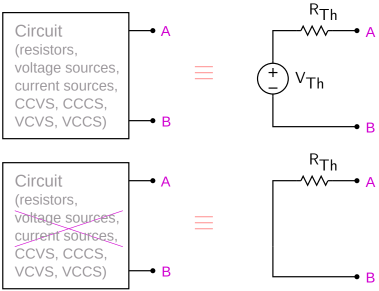
Thevenin's theorem: R_{Th}

Method 1:



∗ Deactivate all *independent* sources.

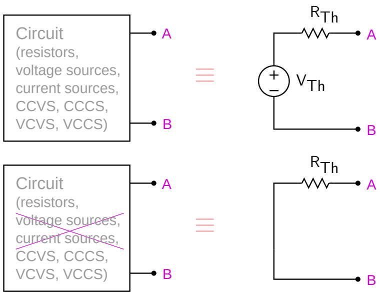
Method 1:



∗ Deactivate all *independent* sources.

Thevenin's theorem: R_{Th}

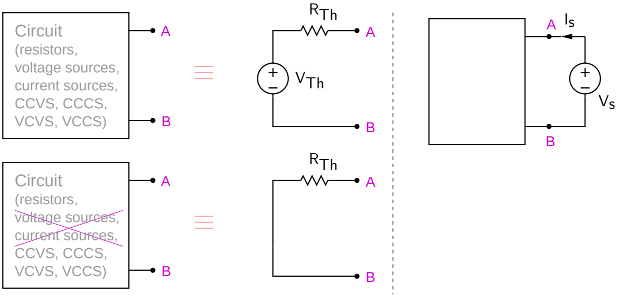
Method 1:



* Deactivate all *independent* sources.
* R_{Th} can often be found by inspection.

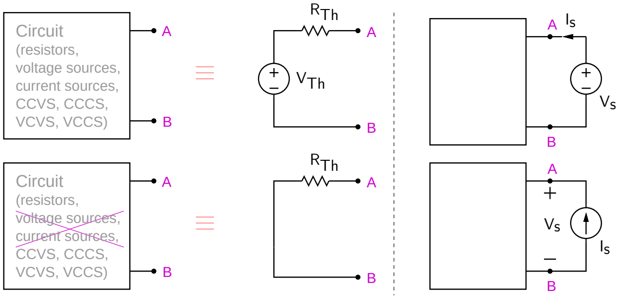
Thevenin's theorem: R_{Th}

Method 1:



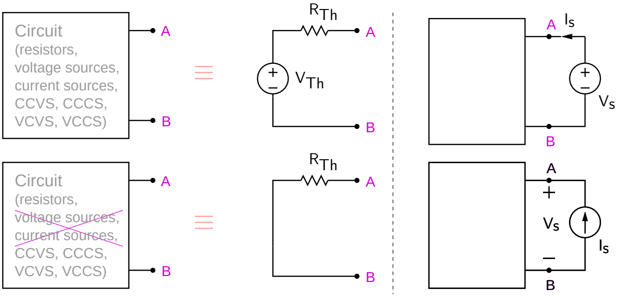
* Deactivate all *independent* sources.
* R_{Th} can often be found by inspection.
* R_{Th} may be found by connecting a *test* source.

Method 1:



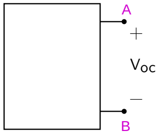
* Deactivate all *independent* sources.
* R_{Th} can often be found by inspection.
* R_{Th} may be found by connecting a *test* source.

Method 1:



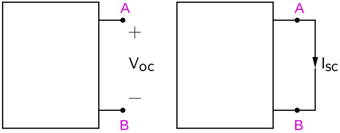
* Deactivate all *independent* sources.
* R_{Th} can often be found by inspection.
* R_{Th} may be found by connecting a *test* source.

Method 2:



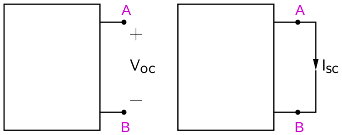
* Find V_{oc}.

Method 2:



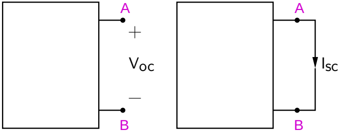
* Find V_{oc}.
* Find I_{sc}.

Method 2:



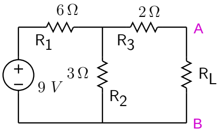
* Find V_{oc}.
* Find I_{sc}.
* $R_{Th} = \dfrac{V_{oc}}{I_{sc}}$.

Method 2:

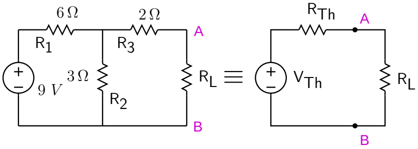


* Find V_{oc}.
* Find I_{sc}.
* $R_{Th} = \dfrac{V_{oc}}{I_{sc}}$.
* Note: Sources are *not* deactivated.

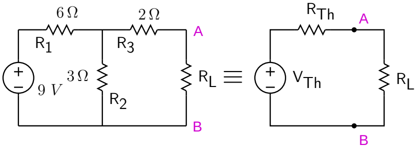
Thevenin's theorem: example



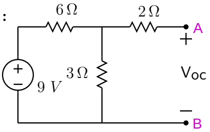
Thevenin's theorem: example



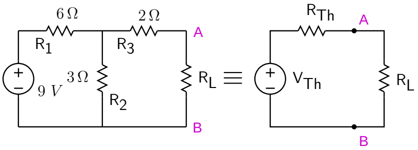
Thevenin's theorem: example

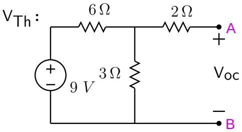


V_{Th}:



Thevenin's theorem: example

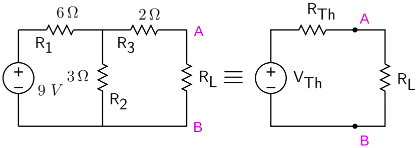


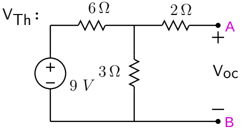


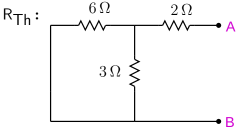
$$V_{oc} = 9\,\text{V} \times \frac{3\,\Omega}{6\,\Omega + 3\,\Omega}$$

$$= 9\,\text{V} \times \frac{1}{3} = 3\,\text{V}$$

Thevenin's theorem: example



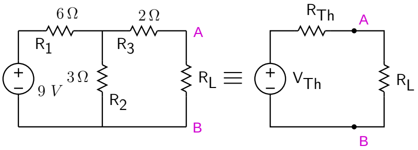


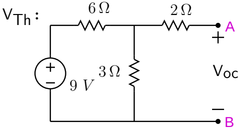


$$V_{oc} = 9\,V \times \frac{3\,\Omega}{6\,\Omega + 3\,\Omega}$$

$$= 9\,V \times \frac{1}{3} = 3\,V$$

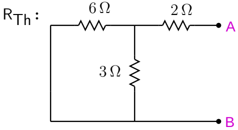
Thevenin's theorem: example





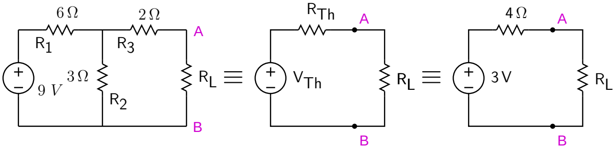
$$V_{oc} = 9\,\mathrm{V} \times \frac{3\,\Omega}{6\,\Omega + 3\,\Omega}$$

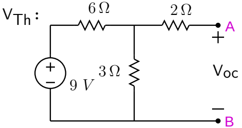
$$= 9\,\mathrm{V} \times \frac{1}{3} = 3\,\mathrm{V}$$

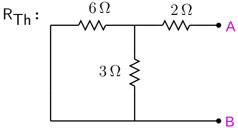


$$R_{Th} = (R_1 \parallel R_2) + R_3 = (3 \parallel 6) + 2$$

$$= 3 \times \left(\frac{1 \times 2}{1 + 2}\right) + 2 = 4\,\Omega$$







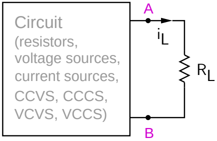
$$V_{oc} = 9\,V \times \frac{3\,\Omega}{6\,\Omega + 3\,\Omega}$$

$$= 9\,V \times \frac{1}{3} = 3\,V$$

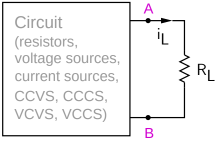
$$R_{Th} = (R_1 \parallel R_2) + R_3 = (3 \parallel 6) + 2$$

$$= 3 \times \left(\frac{1 \times 2}{1 + 2}\right) + 2 = 4\,\Omega$$

Maximum power transfer

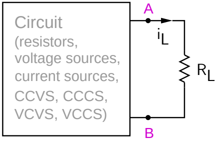


Maximum power transfer



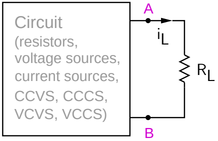
* Power "transferred" to load is,
  $P_L = i_L^2 \, R_L$.

Maximum power transfer



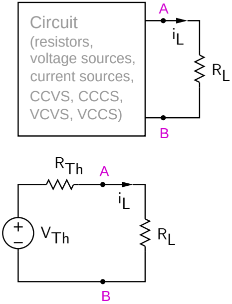
* Power “transferred” to load is, $P_L = i_L^2\, R_L$.
* For a given black box, what is the value of R_L for which P_L is maximum?

Maximum power transfer

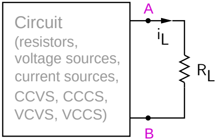


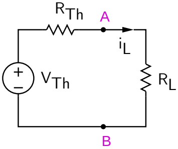
* Power “transferred” to load is, $P_L = i_L^2 R_L$.
* For a given black box, what is the value of R_L for which P_L is maximum?
* Replace the black box with its Thevenin equivalent.

Maximum power transfer



* Power "transferred" to load is, $P_L = i_L^2 \, R_L$.
* For a given black box, what is the value of R_L for which P_L is maximum?
* Replace the black box with its Thevenin equivalent.

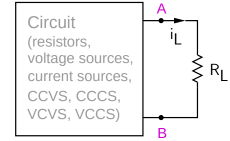


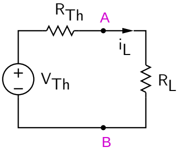


* Power "transferred" to load is, $P_L = i_L^2 \, R_L$.
* For a given black box, what is the value of R_L for which P_L is maximum?
* Replace the black box with its Thevenin equivalent.
* $i_L = \dfrac{V_{Th}}{R_{Th} + R_L}$,

  $P_L = V_{Th}^2 \times \dfrac{R_L}{(R_{Th} + R_L)^2}$.

Maximum power transfer



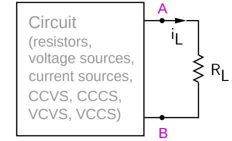


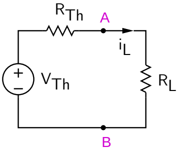
* Power "transferred" to load is, $P_L = i_L^2\, R_L$.
* For a given black box, what is the value of R_L for which P_L is maximum?
* Replace the black box with its Thevenin equivalent.
* $i_L = \dfrac{V_{Th}}{R_{Th} + R_L}$,

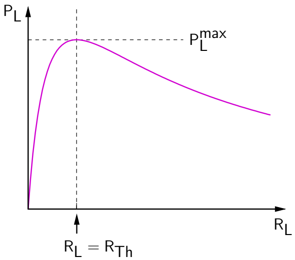
  $P_L = V_{Th}^2 \times \dfrac{R_L}{(R_{Th} + R_L)^2}$.
* For $\dfrac{dP_L}{dR_L} = 0$, we need

$$\frac{(R_{Th} + R_L)^2 - R_L \times 2\,(R_{Th} + R_L)}{(R_{Th} + R_L)^4} = 0\,,$$

i.e., $R_{Th} + R_L = 2\,R_L \Rightarrow R_L = R_{Th}$.







- Power “transferred” to load is,
  $P_L = i_L^2\, R_L$.
- For a given black box, what is the value of R_L for which P_L is maximum?
- Replace the black box with its Thevenin equivalent.
- $i_L = \dfrac{V_{Th}}{R_{Th} + R_L}$,

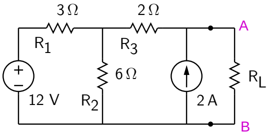
  $P_L = V_{Th}^2 \times \dfrac{R_L}{(R_{Th} + R_L)^2}$.
- For $\dfrac{dP_L}{dR_L} = 0$, we need

  $$\frac{(R_{Th} + R_L)^2 - R_L \times 2\,(R_{Th} + R_L)}{(R_{Th} + R_L)^4} = 0\,,$$

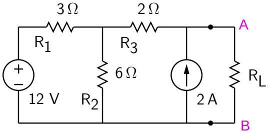
  i.e., $R_{Th} + R_L = 2\,R_L \Rightarrow R_L = R_{Th}$.

Maximum power transfer: example

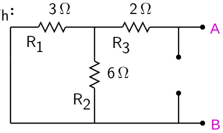
Find R_L for which P_L is maximum.



Find R_L for which P_L is maximum.

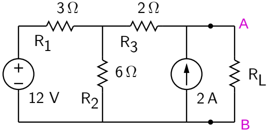


R_{Th}:

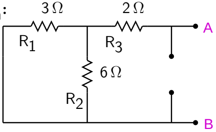


Maximum power transfer: example

Find R_L for which P_L is maximum.



R_{Th}:

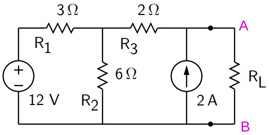


$$R_{Th} = (R_1 \parallel R_2) + R_3 = (3 \parallel 6) + 2$$

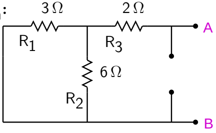
$$= 3 \times \left(\frac{1 \times 2}{1 + 2}\right) + 2 = 4\,\Omega$$

Maximum power transfer: example

Find R_L for which P_L is maximum.



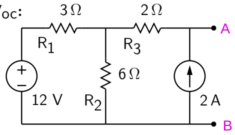
R_{Th}:



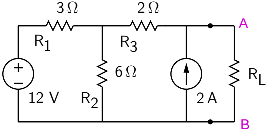
$$R_{Th} = (R_1 \parallel R_2) + R_3 = (3 \parallel 6) + 2$$

$$= 3 \times \left(\frac{1 \times 2}{1+2}\right) + 2 = 4\,\Omega$$

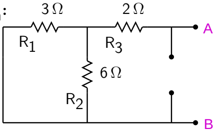
V_{oc}:



Find R_L for which P_L is maximum.



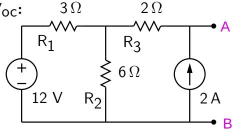
R_{Th}:



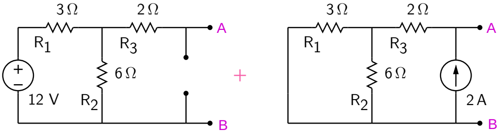
$$R_{Th} = (R_1 \parallel R_2) + R_3 = (3 \parallel 6) + 2$$

$$= 3 \times \left(\frac{1 \times 2}{1 + 2}\right) + 2 = 4\,\Omega$$

V_{oc}:

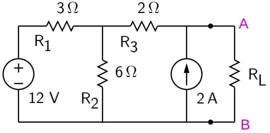


Use superposition to find V_{oc}:

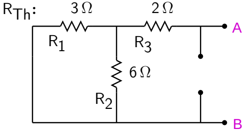


Maximum power transfer: example

Find R_L for which P_L is maximum.



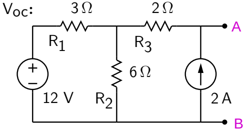
R_{Th}:



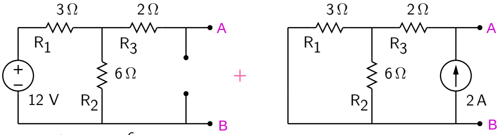
$$R_{Th} = (R_1 \parallel R_2) + R_3 = (3 \parallel 6) + 2$$

$$= 3 \times \left(\frac{1 \times 2}{1+2}\right) + 2 = 4\,\Omega$$

V_{oc}:



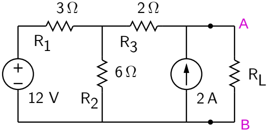
Use superposition to find V_{oc}:



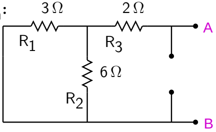
$$V_{oc}^{(1)} = 12 \times \frac{6}{9} = 8\ \text{V}$$

Maximum power transfer: example

Find R_L for which P_L is maximum.



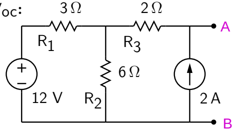
R_{Th}:



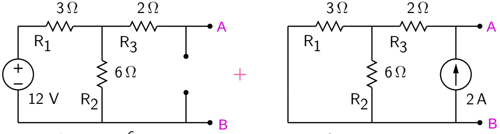
$$R_{Th} = (R_1 \parallel R_2) + R_3 = (3 \parallel 6) + 2$$

$$= 3 \times \left(\frac{1 \times 2}{1+2}\right) + 2 = 4\,\Omega$$

V_{oc}:



Use superposition to find V_{oc}:

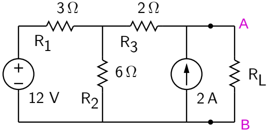


$$V_{oc}^{(1)} = 12 \times \frac{6}{9} = 8 \text{ V}$$

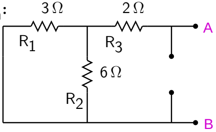
$$V_{oc}^{(2)} = 4\,\Omega \times 2\,A = 8\,\text{V}$$

Maximum power transfer: example

Find R_L for which P_L is maximum.



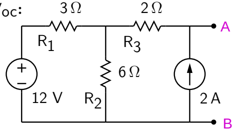
R_{Th}:



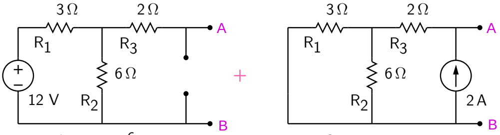
$$R_{Th} = (R_1 \parallel R_2) + R_3 = (3 \parallel 6) + 2$$

$$= 3 \times \left(\frac{1 \times 2}{1+2}\right) + 2 = 4\,\Omega$$

V_{oc}:



Use superposition to find V_{oc}:

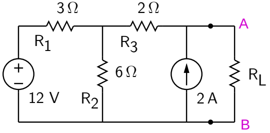


$$V_{oc}^{(1)} = 12 \times \frac{6}{9} = 8\ \text{V} \qquad V_{oc}^{(2)} = 4\,\Omega \times 2\,A = 8\,\text{V}$$

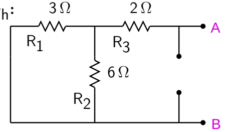
$$V_{oc} = V_{oc}^{(1)} + V_{oc}^{(2)} = 8 + 8 = 16\,\text{V}$$

Maximum power transfer: example

Find R_L for which P_L is maximum.



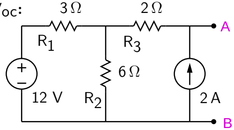
R_{Th}:



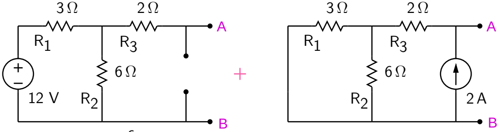
$$R_{Th} = (R_1 \parallel R_2) + R_3 = (3 \parallel 6) + 2$$

$$= 3 \times \left(\frac{1 \times 2}{1+2}\right) + 2 = 4\,\Omega$$

V_{oc}:

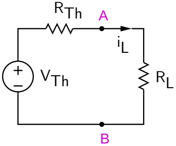


Use superposition to find V_{oc}:



$V_{oc}^{(1)} = 12 \times \frac{6}{9} = 8$ V $\qquad V_{oc}^{(2)} = 4\,\Omega \times 2\,A = 8\,\text{V}$

$$V_{oc} = V_{oc}^{(1)} + V_{oc}^{(2)} = 8 + 8 = 16\,\text{V}$$



P_L is maximum when $R_L = R_{Th} = 4\,\Omega$

$\Rightarrow i_L = V_{Th}/(2\,R_{Th}) = 2\,\text{A}$

$P_L^{max} = 2^2 \times 4 = 16\,\text{W}$.

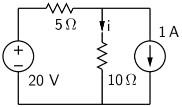
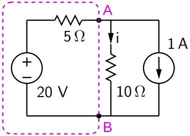
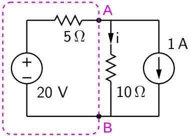
Example



Example

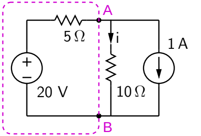


Example



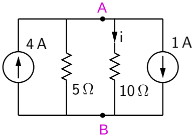
$R_N = 5\,\Omega$

$I_N = \frac{20\text{ V}}{5\,\Omega} = 4\text{ A}$

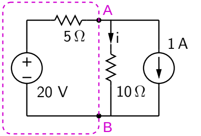


$R_N = 5\,\Omega$

$I_N = \dfrac{20\text{ V}}{5\,\Omega} = 4\text{ A}$

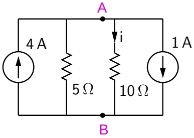


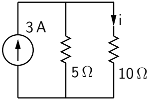
Example



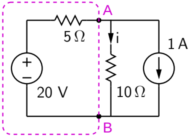
$$R_N = 5\,\Omega$$

$$I_N = \frac{20\,\text{V}}{5\,\Omega} = 4\,\text{A}$$



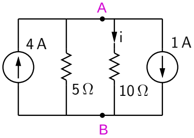


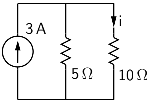
Example



$R_N = 5\,\Omega$

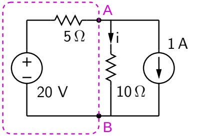
$I_N = \dfrac{20\,\text{V}}{5\,\Omega} = 4\,\text{A}$





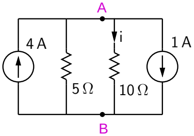
$$i = 3\,\text{A} \times \frac{5}{5+10}$$

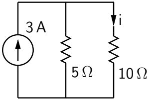
$$= 1\,\text{A}$$



$R_N = 5\,\Omega$

$I_N = \dfrac{20\,V}{5\,\Omega} = 4\,A$





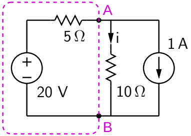
$$i = 3\,A \times \frac{5}{5+10}$$

$$= 1\,A$$

Home work:

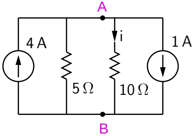
- Find *i* by superposition and compare.

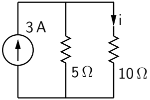
Example



$R_N = 5\,\Omega$

$I_N = \dfrac{20\,\text{V}}{5\,\Omega} = 4\,\text{A}$





$$i = 3\,\text{A} \times \frac{5}{5+10}$$

$$= 1\,\text{A}$$

Home work:

* Find i by superposition and compare.
* Compute the power absorbed by each element and verify that $\sum P_i = 0$.
