Description

`triangle_2.gce` is a symmetric triangular wave source with the general variable `y` as its output. The parameters have the following meaning:

`tperiod:` Period. In the first half, the voltage goes from `g_high` to `g_low` if `i0`=0 (and from `g_low` to `g_high` if `i0`=1).

`t0:` An "offset" time interval. Its meaning will become clear in the following example.

`epsl:` Used in time step control. `epsl` can generally be set to be $0.001 \times \min(\texttt{t1}, \texttt{t2})$.

AC behaviour is not implemented.

The effect of the various paramters of `triangle_2.gce` on the waveforms is shown in Fig. 1. The corresponding circuit file is given below.
