

`const_syncmc.gce`

Attributes

```
mainvars: y  
iparms: indx=0
```

Description

`const_syncmc.gce` is used along with a synchronous machine element (`syncmc_delta.gme` or `syncmc_1.ece`). Its output is a constant which is computed internally in the synchronous machine template and passed to `const_syncmc.gce` through a Fortran common block. The integer parameter `indx` serves to specify which constant is being provided (such as `efd` or `tmech` in the synchronous machine model).

AC behaviour is not implemented.
